Reference

This document will keep track of the various tools that I use in my Markdown files to generate cool stuff. Compare the generated PDF as well as the raw Markdown file (make sure to click the `raw` button on Github and not use the built-in viewer).

For example, to get a simple orange box with an orange title, you can use this:

> **Title**
> Some text here

There is also the option to add in a colored "subtitle":

> **Theorem** 1.12
> $1 + 1 = 2$

For more generic tcolorbox, you can try:

> **Note**
> A note

> **Definition**
> A definition

> **Theorem**
> A theorem

> **Warning**
> A warning

These are faster to write, but doesn't allow you to customize the title.
