Reference

This document will keep track of the various tools that I use in my Markdown files to generate cool stuff. Compare the generated PDF as well as the raw Markdown file (make sure to click the `raw` button on Github and not use the built-in viewer).

For example, to get a simple orange box with an orange title, you can use this:

> **Theorem 1**
> Note that the blank line separating "begin{mybox}" and "boxtitle" is required for the colored title to work.

There is also the option to add in a colored "subtitle":

> **Definition** (see textbook)
> Make sure there is no blank space between the title and the subtitle if you want them to be on the same line.

For more generic tcolorbox, you can try:

> **Note**
> A note

> **Definition**
> A definition

> **Theorem**
> A theorem

> **Warning**
> A warning

These are faster to write, but doesn't allow you to customize the title.
